This text is a thorough treatment of the rapidly growing area of aerial manipulation. It details all the design steps required for the modeling and control of unmanned aerial vehicles (UAV) equipped with robotic manipulators. Starting with the physical basics of rigid-body kinematics, the book gives an in-depth presentation of local and global coordinates, together with the representation of orientation and motion in fixed- and moving-coordinate systems. Coverage of the kinematics and dynamics of unmanned aerial vehicles is developed in a succession of popular UAV configurations for multicopter systems. Such an arrangement, supported by frequent examples and end-of-chapter exercises, leads the reader from simple to more complex UAV configurations. Propulsion-system aerodynamics, essential in UAV design, is analyzed through blade-element and momentum theories, analysis which is followed by a description of drag and ground-aerodynamic effects. The central part of the book is dedicated to aerial-manipulator kinematics, dynamics, and control. Based on foundations laid in the opening chapters, this portion of the book is a structured presentation of Newton – Euler dynamic modeling that results in forward and backward equations in both fixed- and moving-coordinate systems. The Lagrange – Euler approach is applied to expand the model further, providing formalisms to model the variable moment of inertia later used to analyze the dynamics of aerial manipulators in contact with the environment. Using knowledge from sensor data, insights are presented into the ways in which linear, robust, and adaptive control techniques can be applied in aerial manipulation so as to tackle the real-world problems faced by scholars and engineers in the design and implementation of aerial robotics systems. The book is completed by path and trajectory planning with vision-based examples for tracking and manipulation.

Focusing on the practical aspects of survey sampling, this introduction is intended for a one-term service course in survey sampling for students in the social sciences, business, and natural resources management (college algebra prerequisite). Appealing to the student with a limited background in math.

Building on the foundation of the bestselling first edition, *Aerial Mapping: Methods and Applications, Second Edition* provides you with a practical understanding of aerial photography, remote sensing, and photogrammetric mapping. The content is deliberately semi-technical and processes are discussed in a manner easily accessible to anyone regardless of their technical or scientific background. This new edition highlights the significant changes in equipment and techniques. High-speed computers, scanners, and remote sensors have changed the way mapping is done. The principles of photogrammetry, image analysis, and remote sensing have become dynamically intertwined. With the solid grounding in basic procedures that *Aerial Mapping: Methods and Applications, Second Edition* provides you can apply your knowledge to the special conditions of each aerial mapping project.
