Important notes about CV carb tuning! To properly tune, you MUST: 1. Have selected the BEST main jet for full throttle power (not just a "good" main jet - we mean "the BEST main jet" for power at high rpm). That eliminates the common severe tweaking of the midrange and lower tuning ranges to compensate for a "wrong" main jet. 2.

Find the adjustment screws on the front of the carburetor. There should be two screws on the front of the carburetor, which are used to adjust the air and fuel mixture. Often these look like flat-head screws and you can use a screwdriver to turn them, adjusting the amount of fuel and air mixing in the carb.

Here's our simple outline for basic tuning to get you started. 1) Idle Circuit: With your idle circuit, start at 1 1/2 to 2 turns out on the mixture screw and then wind your idle screw back to give a very slow idle whilst at operating engine temp with the bike upright.

~~[Tuning Tips & Manual Downloads | Mikunioz](#)~~

The pilot screw on your carb controls the idle to about 1/8 to 1/4 throttle position. The pilot screw, which is also made of brass, is long and skinny with a tapered end and a spring. It typically sits on the outside of the carb body. The exact location of the pilot screw will determine whether it controls the air flow or the fuel flow.
