Electricity, simply put, is the flow of electric current along a conductor. This electric current takes the form of free electrons that transfer from one atom to the next. Thus, the more free electrons a material has, the better it conducts. There are three primary electrical parameters: the volt, the ampere and the ohm. 1. The Volt

Protons are positively charged and neutrons (as the name suggests) have no electrical charge. Electrons are negatively charged and they circle around the nucleus. The negatively charged electron is held in place by the positive charge of the proton. This is because unlike poles (or opposites) attract and like poles repel.

This voltage drop principle leads to another important law in basic electrical engineering, Kirchoff ' s Voltage Law (KVL). This law states that the algebraic sum of the voltages in a closed loop is always equal to zero. If we only knew the supply potential and the voltage drop of R1, we could use KVL to find the other voltage drop.
