Rivers are capable of transporting their own bed material without altering their width. However, a naive extension of the threshold theory of canals in coarse alluvium to straight reaches of gravel rivers leads to the stable-channel paradox: transport of bed material is incompatible with a stable width.

Self-formed straight rivers with equilibrium banks and ...

A new relationship is proposed for the Lacey's silt factor estimation in gravel bed rivers. The discharge intensity based Lacey-Inglis procedure when used in conjunction with the relation for estimation of the silt factor proposed herein is expected to produce realistic estimates for the scour depth around bridge piers founded in the gravel bed rivers.

The present model exhibits good agreement with the measurements of the deposited sediment in gravel-bed rivers. Because the present model simulates the deposition process of sediment mixtures, it can be coupled with computational fluid dynamic and sediment transport models for predicting morphodynamics in gravel-bed rivers.

Eulerian Deposition Model for Sediment Mixture in Gravel ...

Bedload transport in gravel-bed rivers is accomplished by means of the mobilization of grains exposed on the bed surface. This mobilization is due to the action of fluid forces on the exposed grains. Substrate particles can participate in the bedload only to the extent that local or global scour results in their exposure on the surface.

The upper surface (1') of the gravel bed is worked by a working machine with a fitted implement in a manner to form at least two parallel gravel-bed strings (10, 11). Giga-fren Two types of habitat were used in the study: a complex habitat created by placing woody debris on a gravel bed and a uniform habitat consisting of a gravel bed only.
