This book presents 16 essays in the New Literacy Studies tradition spanning the period from 1985-2010. It covers a diverse range of themes integral to the overall research program undertaken by many people all over the world from the New Literacy Studies perspective, with a particular emphasis on topics of cultural, political and historical interest. The essays combine previously published and unpublished works that are evenly distributed across the 25-year period. The book is organized in four sections. Topics addressed in Part 1 include functional literacy, the politics of literacy in Nicaragua during the Sandinista period (1979-1990), the rise of the working class press in Britain, and reader response and the teacher as meaning-maker. Part 2 discusses critical literacy and active citizenship, literacy and empowerment, language and the new capitalism, varying ways of using computers in and out of school, and the way a low achieving student challenges conventional notions of literacy failure. Part 3 addresses the New Literacy Studies and the study of new literacies, the theory and practice of attention

economics, and early developments in the use of ratings within online communities and social practices. The final part of the book takes up the theme of researching new literacies, discusses practices of digital remix, and provides a case study of becoming research literate within a context of DIY media creation.

The deep subsurface is, in addition to space, one of the last unknown frontiers to human kind. A significant part of life on Earth resides in the deep subsurface, hiding great potential of microbial life of which we know only little. The conditions in the deep terrestrial subsurface are thought to resemble those of early Earth, which makes this environment an analog for studying early life in addition to possible extraterrestrial life in ultra-extreme conditions. Early microorganisms played a great role in shaping the conditions on the young Earth. Even today deep subsurface microorganisms interact with their geological environment transforming the conditions in the groundwater and on rock surfaces. Essential elements for life are richly present but in difficultly accessible form. The elements driving the microbial deep life is still not completely identified.

Most of the microorganisms detected by novel molecular techniques still lack cultured representatives. Nevertheless, using modern sequencing techniques and bioinformatics the functional roles of these microorganisms are being revealed. We are starting to see the differences and similarities between the life in the deep subsurface and surface domains. We may even begin to see the function of evolution by comparing deep life to life closer to the surface of Earth. Deep life consists of organisms from all known domains of life. This Research Topic reveals some of the rich diversity and functional properties of the great biomass residing in the deep dark subsurface.
