Functional Description of MPLS. Label
switching is a high-performance
packet forwarding technology that
integrates the performance and
traffic management capabilities of
data link layer (Layer 2) switching
with the scalability, flexibility, and
performance of network layer (Layer
3) routing.

MPLS for Cisco Networks builds up a full MPLS network, utilizing a core MPLS network and several customer sites. You will learn how to use OSPF, EIGRP, and RIP at the customer sites and redistribute them through the provider network. Learn how the routers swap labels, and how to control this, how to implement MultiProtocol BGP within the provider network, and how to set up VRFs (Virtual Routing and Forwarding) to segregate and combine (leak) routes across the network.

initially proposed to improve forwarding speed. Its core technology can be extended to multiple network protocols, such as IPv6, Internet Packet Exchange (IPX), and Connectionless Network Protocol (CLNP). That is what the term multiprotocol means.

MPLS Basics - Cisco

Multiprotocol label switching (MPLS) combines the performance and capabilities of Layer 2 (data link layer) switching with the proven scalability of Layer 3 (network layer) routing. MPLS enables service providers to meet the challenges of explosive growth in network utilization while providing the opportunity to differentiate services without sacrificing the existing network infrastructure.

An MPLS network is commonly a backbone network comprised of MPLS-enabled routers called Label Switch Routers (LSR). Generally, the network consists of a core LSR with an edge LSR that applies labels to packets. This is the setup mechanism of an MPLS network: Routing tables of the different LSRs are computed with an Interior Gateway Protocol (IGP).

MPLS Configuration Lab -The Routing Table

MPLS is best summarized as a “ Layer 2.5 networking protocol ” . In the traditional OSI model: Layer 2 covers protocols like Ethernet and SONET, which can carry IP packets, but only over simple LANs or point-to-point WANs. Layer 3 covers Internet-wide addressing and routing using IP protocols.
