The current through, or voltage across, any element of a network is equal to the algebraic sum of the currents or voltages produced independently by each source. In other words, this theorem allows us to find a solution for a current or voltage using only one source at a time.

Thevenin's theorem states that any two terminal linear network or circuit can be represented with an equivalent network or circuit, which consists of a voltage source in series with a resistor. It is known as Thevenin's equivalent circuit. A linear circuit may contain independent sources, dependent sources, and resistors.

Network theorems, such as Millman's, Superposition, Thevenin's, and Norton's theorems provide the framework necessary for more specific problem solving techniques Branch Current Method The first and most straightforward network analysis technique is called the branch current method. In this method, we assume directions of currents in a network, and then write
