Aaen, Olav, Clutch Tuning Handbook. Aaen Performance, 1995. Continuously Variable Transmissions for Passenger Cars. SAE Publication, PT-30, 1986. ISBN 0-89883-118-0. Stokes, Alec, Manual Gearbox Design. Butterworth/Heinemann, 1992. ISBN 1-56091-256-1. (Distributed by SAE) Fabrication. Finch, Richard, Performance Welding. Motorbooks International, 1997.

A must-have book for anyone designing manual gearboxes, based on 40 years of industrial experience.

An introductory engineering textbook by an award-winning MIT professor that covers the history of dynamics and the dynamical analyses of mechanical, electrical, and electromechanical systems. This introductory textbook offers a distinctive blend of the modern and the historical, seeking to encourage an appreciation for the history of dynamics while also presenting a framework for future learning. The text presents engineering mechanics as a unified field, emphasizing dynamics but integrating topics from other disciplines, including design and the humanities. The book begins with a history of mechanics, suitable for an undergraduate overview. Subsequent chapters cover such topics as three-dimensional kinematics; the direct approach, also known as vectorial mechanics or the momentum approach; the indirect approach, also called lagrangian dynamics or variational dynamics; an expansion of the momentum and lagrangian formulations to extended bodies; lumped-parameter electrical and electromagnetic devices; and equations of motion for one-dimensional continuum models. The book is noteworthy in covering both lagrangian dynamics and vibration analysis. The principles covered are relatively few and easy to articulate; the examples are rich and broad. Summary tables, often in the

form of flowcharts, appear throughout. End-of-chapter problems begin at an elementary level and become increasingly difficult. Appendixes provide theoretical and mathematical support for the main text.

The Best of Peter Egan offers a "greatest hits" collection of Egan's motorcycle musings from the past four decades, delivered in his signature, wise but amusing, style. Peter Egan's writing invites you to pull up a chair, pour a little scotch, and relax while he shares with you his tales from the road, his motorcycling philosophy, and his keen observations about the two-wheeled life. For some forty years, Peter Egan's columns and feature articles have been among Cycle World's most anticipated monthly content. Egan's legions of fans know they will gain a fresh perspective on motorcycling from each of his articles. Drawings from motoring artist Hector Cademartori beautifully illustrate Egan's musings, and a foreword by super-enthusiast Jay Leno introduces the book. This is an unforgettable collection from a master writer whose simple adventures of two-wheeled life remind us why we love to ride.

Genetic programming, a form of genetic algorithm that evolves programs and program-like executable structures, is a new paradigm for developing reliable, time- and cost-effective applications. The second volume of *Advances in Genetic Programming* highlights many of the most recent technical advances in this increasingly popular field. The twenty-three contributions are divided into four parts: Variations on the Genetic Programming Theme; Hierarchical, Recursive, and Pruning Genetic Programs; Analysis and Implementation Issues; and New Environments for Genetic Programming. The first part extends the core concepts of genetic programming through the addition of new evolutionary techniques -- adaptive and self-adaptive crossover methods, hill climbing operators, and the inclusion of introns into the representation. Creating more concise executable structures is a long-term research topic in genetic programming. The second part describes the field's most recent efforts, including the dynamic manipulation of automatically defined functions, evolving logic programs that generate recursive structures, and using minimum description length heuristics to determine when and how to prune evolving structures. The third part takes up the many implementation and analysis issues associated with evolving programs. Advanced applications of genetic programming to nontrivial real-world problems are described in the final part: remote sensing of pressure ridges in Arctic sea ice formations from satellite imagery, economic prediction through model evolution, the evolutionary development of stress and loading models for novel materials, and data mining of a large customer database to optimize responses to special offers.

The value and collectability of muscle cars has never been higher. Models that sold for \$30,000 at auction 10 years ago are now going for quadruple that in many cases. The charts showing auction results, sale prices, and car value have a continuous upward trajectory. As such, some rare models of muscle cars are now valued in the realm of historically high-valued classic, sports, and show cars. Who would have dreamed that a Hemi 'Cuda convertible would be selling for Duesenberg or Ferrari money these days? Of course, when values of muscle cars increase to such an extent, the care and detail spent on restoration becomes vitally important, putting them into the exotic and show car realm. Naturally, the most visible aspect of a full-blown restoration is the paintwork. Veteran author Tony Thacker teams up with LA-based award-winning painter extraordinaire Mick Jenkins to bring you this complete guide to show-quality painting. Included is all the information on how to create a show-quality finish, including chapters on making a plan, the tools needed for the job, complete disassembly information, repair versus replacement decisions, metal prep, the latest and best paint products, application, custom finishes, and more.

The manual contains separate sections for vehicle service, engines, converters, track drive, track and suspension, and skis and steering.
