A synthetic-aperture radar is an imaging radar mounted on a moving platform. Electromagnetic waves are transmitted sequentially, the echoes are collected and the system electronics digitizes and stores the data for subsequent processing. As transmission and reception occur at different times, they map to different positions.

What's Synthetic about SAR? The electromagnetic spectrum with microwave bands inset. The spatial resolution of radar data is directly related to the ratio of the sensor wavelength to the length of the sensor's antenna. For a given wavelength, the longer the antenna, the higher the spatial resolution.

Principles of Synthetic Aperture Radar Imaging: A System Simulation Approach is dedicated to the use, study, and development of SAR systems. The book focuses on image formation or focusing, treats platform motion and image focusing, and is suitable for students, radar engineers, and microwave remote sensing researchers.

Synthetic aperture radar (SAR) satellites collect swaths of side-looking echoes at a suf-iciently high range resolution and along-track sampling rate to form high resolution imagery (see Figure A1). As discussed in this appendix, the range resolution of the raw radar data is determined by the pulse length (or 1/bandwidth) and the incidence angle.

A Synthetic Aperture Radar was used on board of a Space Shuttle during the Shuttle Radar Topography Mission (SRTM). SAR radar is partnered by what is termed Inverse SAR (abbreviated to ISAR) technology which in the broadest terms, utilizes the movement of the target rather than the emitter to create the synthetic aperture. ISAR radars have a significant role aboard maritime patrol aircraft to provide them with radar image of sufficient quality to allow it to be used for target recognition ...

Principles of Synthetic Aperture Radar Because of the way in which microwaves interact with the atmosphere and the ground, only a select few frequency bands are useful for imaging. These are shown in Figure 5. The wavelength affects the penetration depth and also the size of a target necessary to return the radar. This shall be discussed later.

Synthetic Aperture Radar (SAR) is a microwave imaging system. It has cloud penetrating capabilities because it uses microwaves; it has day and night operational capabilities because it is an active system; and its 'interferometric configuration'. Interferometric SAR or InSAR, allows accurate measurements of the radiation travel path because it is coherent.

A pulse-Doppler radar is a radar system that determines the range to a target using pulse-timing techniques, and uses the Doppler effect of the returned signal to determine the target object's velocity. It combines the features of pulse radars and continuous-wave radars, which were formerly separate due to the complexity of the electronics.. The first operational Pulse Doppler radar was in the ...

Synthetic Aperture Radar (SAR) is an active microwave imaging method.It operates independently of Sun illumination and cloud coverage. Currentspaceborne systems use wavelengths of 3 to 25 cm and achieve resolutionsof 10 to 50 m. The paper attempts to explain the basic SAR imaging principlesusing a minimum of mathematics.
