We use three types of current transformers that come in all sizes. Split Core CT: A split core CT breaks in half and reattaches. This allows installation within existing, live environments without changing or unplugging wiring. Because there is a break in the coil inside the transformer, they're not considered as accurate as a solid core CT.

Core selection. Core area for standard core (steel laminations) is equal to the square root of the power. Thus for a 360VA transformer you need a "tongue" core area of 19 sq.cm (at least), with permeability of about 500. With the core you have, you can have a maximum power of 290VA (losses included). In a well designed transformer, the core window will be almost completely.

Extensively revised and expanded to present the state-of-the-art in the field of magnetic design, this third edition presents a practical approach to transformer and inductor design and covers extensively essential topics such as the area product, Ap, and core geometry, Kg. The book provides complete information on magnetic materials and core characteristics using step-by-step design examples and presents all the key components for the design of lightweight, high-frequency aerospace transformers or low-frequency commercial transformers. Written by a specialist with more than 47 years of experience in the field, this volume covers magnetic design theory with all of the relevant formulas.
