The U.S. census, conducted every 10 years since 1790, faces dramatic new challenges as the country begins its third century. Critics of the 1990 census cited problems of increasingly high costs, continued racial differences in counting the population, and declining public confidence. This volume provides a major review of the traditional U.S. census. Starting from the most basic questions of how data are used and whether they are needed, the volume examines the data that future censuses should provide. It evaluates several radical proposals that have been made for changing the census, as well as other proposals for redesigning the year 2000 census. The book also considers in detail the much-criticized long form, the role of race and ethnic data, and the need for and ways to obtain small-area data between censuses.

Providing a comprehensive assessment of the strategies of banks and insurance companies in the move towards an internal European market for financial services, this book analyzes the latest theoretical and institutional developments. It also provides a range of case studies of actual cross-border entry strategies of some of the largest European financial institutions.

This edited volume offers a new and original approach to the study of technological change in retail finance. Documenting developments in the US alongside case studies from Mexico and Europe, Technological Innovation in Retail Finance addresses the variety of financial institutions that populated the markets for retail finance. It offers a massive research base reflecting not only breadth of contributor interests, but also a unity of purpose that comes from several workshops and comments on each other's work. Technological innovation had a major role in the shaping and developing of administrative procedures, routines, and capabilities in organizations offering retail financial services. Indeed, with the exception of contemporary case studies for the UK, the current 'state of the art' in the study of the computerization of financial services from an historical perspective is overwhelmingly focused on developments in the USA. This volume overcomes the usual bias towards the so called 'Atlantic continuity' in the understanding of technological change related to applications of information and telecommunication technologies (ICT) by offering a number of sources of distinctiveness. It shows when and how technological change altered the competitive intensity in the markets for retail finance.
