We learn that tuna are constrained to some extent by the availability of oxygen and appropriate water temperatures and that these constraints depend on time of day, season, stage of development, and reproductive status. The tuna lifestyle seems to have three phases:

Tuna-farming could help reduce pressure on the tuna population, but the problem is that the majority of cage-farmed fish is caught in its natural environment (wild population), and thus is fattened or farmed to a certain size. Additionally, the challenges in tuna farming are numerous.
